

Emergency Preparedness & Response in the Community

"In caring for people LCMS congregations are active in emergency response and management in their communities."

Forward

"In caring for people Lutheran Church—Missouri Synod (LCMS) congregations are active in emergency response and management in their communities."

The LCMS, Texas District President's Task Force on Disaster Response prepared this manual to aid congregations as they reach out to the community in times of natural or man made disaster. Our congregations, as part of their community, have the opportunity and responsibility to aid their friends and neighbors in times of need. Meeting the needs of those whose lives are turned upside down requires meeting both physical and mental needs.

This document is provide to assist congregations prepare for Disaster.

Disaster Response is a Ministry

If anyone has material possessions and sees his brother in need but has no pity on him, how can the love of God be in him? Dear children, let us not love with words or tongue but with actions and in truth. This then is how we know that we belong to the truth, and how we set our hearts at rest in his presence whenever our hearts condemn us. For God is greater than our hearts, and he knows everything.

1 John 3:17-20

Disaster response is a Ministry opportunity. Lutherans reaching out to people in their time of need makes a strong statement about who we are. In 2001 the American Red Cross reported 255 disasters in Texas, affecting 4837 households. In May of 2003 the United States had 200 tornadoes touch down in one week.

The Unprepared Church will miss a valuable opportunity to minister while attempting to react to a disaster in their community. By planning before a disaster's occurrence and coordinating with local Volunteer Organizations Active in Disasters (VOADs), Interfaith Organizations and local government, a church can be prepared to fully minister in times of crisis.

When a disaster hits many people turn to the Church for help and comfort. An important part of disaster response is meeting the spiritual needs of your Church and your community. The Church ministers to people through God's word and prayer. It is important to resume services as soon as possible. It may even be a good ideal to schedule special prayer services.

Have contingency plans in case your facilities are damaged. Identify possible sites to hold a worship service such as a school or community center. Plan how you will publicize where and when services will be held.

Have Elders or other laymen prepared to step in and lead services in case your pastor is effected by the disaster and unable to lead services.

Ministry is an act of serving. By serving those whose lives have been disrupted by disaster, we are demonstrating Christian love in the manner Jesus illustrated in the parable of the Good Samaritan (Luke 10:25-37).

"The mission of the Texas District is to strengthen congregations to reach the lost, disciple the saved and care for people - locally and globally."

How better to accomplish this goal than to reach out to survivors of disaster.

"In caring for people Lutheran Church—Missouri Synod (LCMS) Texas District congregations are active in emergency response and management in their communities."

What Is a Disaster?

A disaster is an occurrence such as a hurricane, tornado, storm, flood, earthquake, volcanic eruption, fire, explosion, building collapse, act of terrorism, or other situation that causes human suffering or creates human needs that the victims cannot alleviate without assistance.

God is our refuge and strength, an ever-present help in trouble. God is our refuge and strength, an ever-present help in trouble. Psalm46:1 & 7

What are the phases of a Disaster?

Incident

Incident - “any condition which meets the definition of major disaster or emergency... which causes damage or hardship that may result in a Presidential declaration of a major disaster or an emergency.”

Incident period - “the time interval during which the disaster-causing incident occurs. No Federal assistance shall be approved unless the damage or hardship to be alleviated resulted from the disaster-causing incident, which took place during the incident period or was in anticipation of that incident.

The incident period will be established by the Federal Emergency

Management Agency (FEMA) in the FEMA-State Agreement and published in the Federal Register.”

* The legal definition for the incident period is especially important to

caseworkers involved in the recovery process as it determines the time frame in which applicants are eligible for various forms of Federal disaster assistance.

Response

First respondents in the emergency stage will be family, neighbors, congregations, local fire and police departments, search and rescue teams, American Red Cross (ARC), Salvation Army (SA) and other voluntary agencies. This is usually a very dangerous time. The survivors and the professional rescue people can be endangered if non-professionals are in the way.

Relief

Emergency Response in the Community

Basic human needs are cared for in a temporary way, which may last days or weeks. Medical services, food, clothing, and temporary shelter become available from the ARC, the churches, other helping organizations, or friends and family.

Basic clean up of homes, businesses and streets begins. Utilities begin to be restored. The processes of applying for aid begins by making contact with personal insurance company, ARC and, if presidentially declared FEMA.

Recovery

People begin moving out of shelters and into temporary housing. Homes and lives begin to be rebuilt. People and communities try to return to normal. The recovery stage usually lasts about ten times as long as the relief stage (or in catastrophic disasters where several years are needed for full recovery).

Partners in Disaster

In preparing for or responding to disasters in your community, it will be helpful to know who some of the folks are who will be part of the response/recovery.

The LORD is a refuge for the oppressed, a stronghold in times of trouble. Those who know your name will trust in you, for you, LORD, have never forsaken those who seek you. Psalm 9:9-19

Lutheran Partners

Lutheran Disaster Relief (LDR)

The mission of Lutheran Disaster Response is to demonstrate Christ's compassion for people by promoting health, healing and wholeness for disaster survivors.

LDR is a cooperative program of The Lutheran Church---Missouri Synod and the Evangelical Lutheran Church in America and is supported by LCMS World Relief and ELCA Domestic Disaster Response. The program endeavors to coordinate Lutherans and Lutheran organizations to respond effectively to the needs of disaster victims.

Emergency Response in the Community

Thrivent Financial For Lutherans

Thrivent is a faith based Fortune 500 financial organization helping nearly 3 million members live better lives and give back to their communities. Thrivent is actively involved in disaster response through grants and work days.

Lutheran Social Services of the South (LSSS)

Lutheran Social Services of the South's Disaster Response ministry provides food, clothing, medical assistance and shelter to help families and communities recovering from a catastrophe. Their Disaster Response ministry also aids in the emotional healing process once recovery work has begun. Through the Inter-Lutheran Disaster Response Board, consultation, organizational support, funds and other assistance are available when a disaster strikes.

Other Partners

Voluntary Organizations Active in Disaster (VOAD)

VOADs Bring together voluntary organizations to foster more effective service for the benefit of people affected by disaster. The organization fosters a climate for cooperation at all levels; coordinating policy among member organizations; disseminating information. Many organizations, agencies and church bodies participate in the local VOAD.

Governors Division of Emergency Management

- The State Emergency Management Agency is responsible for developing plans for responding to emergencies in the state and identifying and coordinating resources to assist in responding to and recovering from disasters or emergencies in the state.
- In many states there are local/county Emergency Managers who act in accordance with the state EMA.

Federal Emergency Management Agency (FEMA)

- In a Federal Declared disaster, FEMA coordinates resources required to assist the Local and State authorities in responding to and recovering from the disaster.
- Agency will also assist in developing plans and training for emergency preparedness.

The American Red Cross (ARC)

- Work closely with local/state/federal EMA staff in planning and preparedness for disaster response.
- Can provide damage assessment, emergency shelters, and emergency communications

Emergency Response in the Community

- Distributes emergency supplies (i.e. personal care kits, clean-up kits) Provides for feeding victims and emergency workers at both stationary and fixed sites.
- Responds to disaster welfare inquiries and provides information services.
- Provides emergency financial assistance for food, clothing, rent, bedding, selected furnishings, medical needs, temporary home repairs, occupational supplies, and other essentials on an individual or family basis
- Acts as a referral service to government and private agencies

The Salvation Army (TSA)

- Work closely with local/state/federal EMA staff in planning and preparedness for disaster response.
- Distributes emergency supplies (i.e. personal care kits, clean-up kits) Provides for feeding victims and emergency workers at both stationary and fixed sites.
- Responds to disaster welfare inquiries and provides information services.
- Provides emergency financial assistance for food, clothing, rent, bedding, selected furnishings, medical needs, temporary home repairs, occupational supplies, and other essentials on an individual or family basis
- Acts as a referral service to government and private agencies

Church World Service (CWS)

- CWS, Inc., is the service arm of the National Council of Churches of Christ in the U.S., which includes Disaster Response in the United States, U.S. territories and worldwide.
- The CWS role in disaster is to encourage and support churches working together in a coordinated interfaith response to human need in long-term disaster recovery.
- May provide “Gifts of the Heart” material aid. “Gifts of the Heart” kits can include clean-up, health care, sewing, layette, school, kitchen utensils, food staples, and medical materials, as well as woolen or cotton blankets.
- Can assist in fund-raising from national church bodies by sharing information from the local/state interfaith.
- May provide a one time grant as “seed” money for an Interfaith response organization that is coming together in response to a disaster
- Can publicize needs and help to identify available resources for relief and long-term recovery. Various types of equipment may be available, such as tents, generators, or power washers from churches through the CWS request to meet the need.
- Seeks to promote a holistic approach to disaster recovery which includes:
- Mitigate the dangers of disasters through education, advocacy and local, state/territory or national legislative measures
- Prepare for disasters and for the long-term recovery of survivors
- Project needs and resources after disaster and encourage a coordinated response with other churches and the Interfaith community
- Respond to human need in a collaborative, coordinated way after disaster without duplication or waste.

Emergency Response in the Community

- Trains and appoints year round volunteer CWS Disaster Resource Consultants for each state and territory in the U.S.

Other Partners – Governmental

There are many agencies that work in conjunctions with disaster response and recovery in a Presidentially declared disaster. While these agencies are not part of FEMA, they work closely with them. SBA

- Veterans Assistance
- IRS
- Farmers Home Administration

Preparing Your Congregation

"Teacher, which is the greatest commandment in the Law?" Jesus replied: " 'Love the Lord your God with all your heart and with all your soul and with all your mind.' This is the first and greatest commandment. And the second is like it: 'Love your neighbor as yourself. 'All the Law and the Prophets hang on these two commandments.'" Matthew 22:36-40

Identify Potential Disasters

Find out what types of disasters Occur in your area. Learn your communities warning signals and evacuation plans. This information can be gathered from the National Weather Service, The Office of Emergency Management, and non-profit organizations like the American Red Cross and Salvation Army.

Natural Disaster would include Floods, Hurricanes, Tornadoes, Earthquakes Hail Storms. Man made disaster would include Hazardous Material spills, Railroad accidents, Highway Accidents, Building fires, Nuclear Accidents, and Terrorism.

Appoint and Train a Congregational Disaster Response Coordinator

Find someone in your congregation to serve as congregational disaster response coordinator. This person should become acquainted with local emergency management leadership, coordinate and guide the congregation through its preparation and response.

The Church Coordinator needs to compose a list of Emergency Response contacts. That list should include your Lutheran Social Services representative and the Disaster Coordinator for Thrivent as well as the local chapters of the American Red Cross and the Salvation Army.(FEMA and your local VOAD group will look to the Red Cross and the Salvation Army for first response).

The Church Coordinator should represent your congregation in the local VOAD. It is important to become involved with the VOAD before a disaster occurs. A well organized VOAD can help bringing aid and comfort to survivors quickly.

Emergency Response in the Community

The Church Coordinator should work with the leadership of the congregation to develop and maintain a disaster response plan. He should try to provide opportunities for the congregation to receive training useful to disaster Response such as CPR training.

He should work with the properties committee or board of trustees to ensure that the facilities remain safe and that emergency equipment functions properly.

Prepare to aid in times of disaster

Here are some ways your congregation can become involved in disaster response. Take steps now to become involved so that you will know what you need to do when a disaster hits

- Arrange agreements to work with the Red Cross and other emergency management agencies if a disaster strikes. Through this type of agreement your congregation will know what it can do to have immediate positive impact in a disaster situation.
- Become a American Red Cross Emergency Shelter. The Red Cross often uses Church buildings near the disaster area as Temporary shelters. The Church must be certified prior to the disaster. Your local Red Cross Chapter will be glad to work with you to meet the requirements for certification.
- Develop a plan to receive, organize and distribute food, hygiene supplies, cleaning Items, and baby supplies. Coordinate this plan with your local VOAD or Interfaith group so that efforts are not duplicated.
- Plan to use your Church to house out of town volunteers.
- Organize volunteer work crews to help in your area in a time of disaster.
- Organize a group of prayer warriors. Prayer is a mighty power. Organize a group to pray regularly for those affected by the disaster, Emergency workers, and volunteers.
- Make plans to hold a blood drive. Immediately following a disaster there is usually a need for blood donations. Have a group sign up to give blood.

Major Don'ts of Disaster Response

- *Don't just go.* A disaster scene is filled with confusion unexpected and uncoordinated volunteers showing up only add to the chaos. Offer to send volunteer work teams as they are needed. Schedule volunteer work through your VOAD or Interfaith Organization. Volunteers will be needed to assist in clean up, removal of debris, repairs and distributing meals for volunteers.
- *Don't send stuff!* Although survivors of a disaster have many needs, Just sending furniture clothing and other goods often causes major problems for a recovering neighborhood. Discuss with your VOAD or Interfaith response group what is needed before you collect anything. Often the best solution is to collect cash Cash contributions allow Trained case workers to help survivors with their most pressing needs. Cash Contributions also help stimulate the local economy that may have been seriously Damaged by the disaster.
- *Don't offer services you cannot fulfill* Disaster Survivors have had their lives turned upside down. They do not need more disappointment. Only offer help you know you can give.

Organizing a Disaster Volunteer Group

What, then, shall we say in response to this? If God is for us, who can be against us? Romans 8: 31

When the recovery phase begins, it will be necessary to organize work groups to clean up debris and work on repairs.

Group sizes will vary based on the work that will be done. Ten to twelve people is a good size for a group doing rebuilding or repair work. A ratio of one skilled worker for every four unskilled workers is a good ideal. When youth are involved you should maintain a ratio of one adult for every four youth.

Important Facts to know for your work Group

- What is the scope of the work to be done?
- What is the anticipated timetable?
- What Skills do the volunteers need?
- Are there any Considerations that are particular to this disaster that should be considered?
- Where is the funding coming from for materials that are needed.
- What is being done to food and restroom facilities on the site?

Qualities to look for in a Volunteer Group Leader.

- Organizational Abilities. He must be able to plan arrangements for the project and organize the group at the project site.
- Decision making ability. The leader may have to make quick, rational decisions
- Listening Skills. A good leader must be able to listen to advice and accept counsel from those with knowledge.
- Flexibility. Rarely does work at a disaster site go exactly to plan. A good leader must be able to adapt.
- A motivator. He must be able to motivate the workers to complete the task.
- Sensitive to people of different cultural and ethnic backgrounds.
- Unselfish, forgiving, able to build unity.

Items Needing to be brought by volunteers.

- Medical release form. Medical History/allergies current tetanus shot (to be given to group Leader)
- Work clothes and foot ware appropriate for the work that is being done. Including work gloves, dust mask and eye protection when appropriate.
- Tools appropriate for the task being performed.
- First aid kit.
- Drinking water
- Sun Screen and insect repellent
- If you are traveling to the work site:
 - Personal Toiletries
 - Sleeping bag and pillow

Emergency Response in the Community

- Bible notebook and pencil
- Flashlight
- Camera and film
- Cash or travelers checks
- Food and Supplies
- A Good Attitude

Behavior of a good work group.

- Volunteers prepare for work with a prayer.
- Volunteers develop strong bonds
- Volunteers respect both talents and limitations of one another
- Volunteers experience growth and joy in expressing their faith through service.

Case Management

No, in all these things we are more than conquerors through him who loved us. For I am convinced that neither death nor life, neither angels nor demons, neither the present nor the future, nor any powers, neither height nor depth, nor anything else in all creation, will be able to separate us from the love of God that is in Christ Jesus our Lord. Romans 8:37-39

In undeclared disasters and as monetary support from State and Federal resources decrease in a declared disaster, the need for support and sensitivity on the part of the Church increases.

Church World Services defines case management as follows:

Case management is specialized care that empowers survivors to move beyond their current condition towards realizing their God-given potential. The job of the case manager is to enable clients to care for their own needs, make their own recovery and then exit.

Case management is not something every Church will want to get involved with . If you should want to do case management Lutheran Disaster response can supply a number of resources and forms to help you.

It is the responsibility of those providing case management to ensure that the needs of every disaster survivor are being met. This will involve canvassing the affected neighborhoods and constant follow up of those who were effected.

Case management includes:

- Assessment. Collecting information from the survivor to determine what services are needed. A case manager must maintain a professional relationship with the survivor at all times. The case worker must try to see things through the survivors eyes to fully comprehend the situation.
- Recovery Plan. The recovery plan is a collaboration between the case manager and the survivor. A list of disaster related needs is created and prioritized. All available resources are identified to meet these needs.

Emergency Response in the Community

Any unmet needs do to insufficient or nonexistent resources are identified and passed on to the unmet needs committee of your VOAD or Interfaith organization.

- Arranging for Services. Contacting service providers and negotiating delivery of needed services to the survivor.
- Follow-up. It is important to follow up with the survivor on all aspects of the recovery plan.
- Reassessment. The case manager must reassess the situation to identify any changes that have occurred since the original assessment and measure progress toward the completion of the recovery plan.
- Record Keeping. Maintaining detailed records on contacts with the survivors and with service providers is very important. A file should be started upon first contact with the survivor and detail any pertinent information on the survivor and delivery of service.

Case management is a very complicated aspect of disaster recovery. If you decide to undertake this task, you need to fully investigate how case management works. Lutheran Social Services of the South, FEMA and the American Red Cross can all provide you information on disaster case management.

APPENDIX B: DISASTERS: DECLARED AND UNDECLARED

Once a disaster has occurred, there are a number of ways that it may be designated. Below are listed the types of disaster declarations and a brief explanation of each.

Undeclared Disasters

In some instances, disaster assistance may be obtained from the Federal Government and voluntary agencies without a Presidential Declaration of a major disaster or an emergency. Federal establishments, particularly military installations which are located in or near the disaster area, may provide immediate lifesaving assistance, and other Federal agencies may be able to provide assistance under their own statutory authorities.

State Declared

In cases where an occurrence is not expected to exceed the capability of the Local and State Governments to respond, rendering the State ineligible to qualify under the definition of a major disaster, the Governor of a State, or the Acting Governor in her/his absence, may declare a State of Emergency or Disaster for the State.

Such a declaration specifies the location and type of damage, as well as the period of incidence.

The declaration officially activates the State Emergency Operations Plan and authorizes the use of selected state agencies to provide support to the affected countries.

Emergency Declarations

When an incident occurs or threatens to occur in a state, which would not qualify under the definition of major disaster, the Governor of a State or Acting Governor in her/his absence, may request that the President declare an emergency.

Under an Emergency Declaration limited assistance may be provided as requested by the Governor. Type of declaration could be:

Emergency Response in the Community

Disasters Housing (only) or a combination of programs which fall short of the need for a major declaration.

USDA Only

USDA food and Nutrition may provide commodities for use in mass feeding by certified voluntary agencies.

Does not require a presidential declaration to activate.

Emergency physical and production loss program through the USDA Farm

Service Agency requires a secretarial designation that includes the specified counties and contiguous counties.

Rural development aid is available through the USDA Rural Housing Service

Voluntary Agency Assistance

An essential element of any disaster relief effort is the assistance provided by private relief organizations in the distribution of food, medicine, supplies, the provision of emergency shelter, and the restoration of community services.

The ARC can provide vouchers and other types of assistance to individuals and families to meet their emergency, disaster-caused needs.

Volunteer organizations, other charitable agencies, community-based organizations, and church groups provide significant assistance to those in need of help.

Declared Disasters

A Declared Disaster is the means by which FEMA assists a state in carrying out its responsibilities to alleviate suffering and damage that result from a major disaster or emergency. Not all programs are available in every declared disaster. Programs may be added after the original declaration.

The following are types of disaster declarations and the programs associated with them:

SBA Only Declaration

In instances where a disaster has impact limited to a small number of families and businesses that would not warrant a declaration of major disaster the Administrator of the SBA, at the request of a governor of a state, may declare a county or counties as a SBA Administrative Declaration.

The criteria for such a declaration is that there are 25 homes and or

Emergency Response in the Community

businesses in a county affected and that they have 40% or greater uninsured losses to contents and/or real property.

Public Assistance Only

The term which refers to supplemental assistance to local and state governments and certain private non-profit organizations after a disaster declaration.

Eligible applicants include local government and any political subdivision of the state, Indian tribe and/or Alaskan native village.

Private non-profit organizations are those which operate the following types of facilities: educational, utility, emergency, medical, custodial care and those providing essential services of a governmental nature to the general public.

PA only declarations do not generally affect the VOLAG sector of the community. For further information contact a local/state EMA official.

Individual Assistance Only

A Presidential declaration of a major disaster can make a broad range of assistance available to individual survivors. This **Individual Assistance** may include some or all of the following:

Temporary housing, until alternative housing is available, for disaster victims whose homes are uninhabitable.

Home repair funds may be given to owner-occupants in lieu of other forms of temporary housing assistance, so that families can quickly return to their damaged homes. Repair funds are given so that the house may be returned to safe, sanitary and secure conditions.

Disaster unemployment assistance and job placement assistance for those unemployed as a result of a major disaster.

Individuals and family grants of up to \$13,600 (this amount is adjusted for inflation annually) to help meet disaster-related necessary expenses or serious needs when those affected are unable to meet such expenses or

Emergency Response in the Community

needs through other programs or other means.

Legal advice for those affected by the disaster.

Crisis counseling and referrals to appropriate mental health agencies to relieve disaster-caused mental health problems.

Loans to individuals, businesses, and farmers for repair, rehabilitation, or replacement of damaged real and personal property and some production losses not fully covered by insurance.

Agricultural assistance, including technical assistance; payments covering a major portion of the cost to eligible farmers who perform emergency conservation actions on farmland damaged by the disaster, and provision of federally owned feed grain for livestock and herd preservation.

Veteran's assistance, such as death benefits, pensions insurance settlements, and adjustments to home mortgage held by the Department of Veterans Affairs (VA) if a VA-insured home has been damaged.

Tax relief, including help from the Internal Revenue Service in claiming casualty losses resulting from the disaster, and State tax assistance.

Waiver of penalties for early withdrawal of funds from certain time deposits.

The Cora Brown Fund which may assist victims of natural disasters for those disaster-related needs that have not been or will not be met by government agencies or private organizations that have programs to address such needs.

Hazard Mitigation

In addition to the assistance provided to individual and to local and state governments, FEMA also provides technical assistance and grants for Hazard Mitigation projects and activities

Emergency Response in the Community

Hazard Mitigation involves the identification and implementation of measures to reduce the severity of future disaster.

Hazard Mitigation assistance includes:

Technical evaluation and guidance in preparing or updating the required State Hazard Mitigation Plan.

Technical evaluation from Interagency Hazard Mitigation Teams or Hazard Mitigation survey Teams will survey the area following the disaster declaration to identify mitigation measures that may reduce future damages.

Funding of mitigation projects through the Hazard Mitigation Grant Program (HMGP) which can fund up to 50% of the cost of a project.

The measures funded must be cost effective and environmentally compatible and should be identified throughout the evaluation of hazards in the preparation of the State Hazard Mitigation Plan.

Total federal funds available for the HMGP are limited to 15% of the federal share of permanent restorative work completed in the program with overall financial and program management responsibilities.

Eligible applicants for the grants include local units of organizations and state agencies.

Communities can apply through the state for the HMGP following a presidential disaster declaration

The state is responsible for identifying and prioritizing projects.

Examples of projects under the HMGP:

Acquisition or relocation projects

Structural hazard control or protection

Construction activities that result in protection from hazard

Flood proofing of facilities

A Presidential Disaster Declaration can include SBA, PA, IA and Hazard

Mitigation together as part of one declaration.

Each Presidential Declaration is state specific. Declarations do not cross state boundaries

Emergency Response in the Community

Declarations are given for specific counties with-in a state, as requested by the state

Counties and programs can be added to a declaration, at the request of the state, with supporting documentation

Appendix I: Biological and Chemical Attacks

This section was reprinted from the Emergency Planning Guide Presented at the Homeland Security Forum at Gloria Dei Lutheran Church
18220 Upper Bay Road, Nassau Bay, Texas

Information About Chemical Attack

General Instructions

- ❑ Use extreme caution when helping others who have been exposed to chemical agents:
- ❑ Remove all clothing and other items in contact with the body. Cut off contaminated clothing to avoid contact with the eyes, nose, and mouth. Put into a plastic bag if possible.
- ❑ Decontaminate hands using soap and water. Remove eyeglasses or contact lenses. Decontaminate glasses in a pan of household bleach.
- ❑ Flush eyes with lots of water.
- ❑ Gently wash face and hair with soap and water; then thoroughly rinse with water.
- ❑ Decontaminate other body areas likely to have been contaminated. Blot (do not swab or scrape) with a cloth soaked in soapy water and rinse with clear water.
- ❑ Change into uncontaminated clothes. Clothing stored in drawers or closets is likely to be uncontaminated.
- ❑ If possible, proceed to a medical facility for screening.

Chemical Agents

Cyanide:

- A fast-acting, potentially deadly chemical that can exist in various forms.
- Gas sometimes is described as having a “bitter almond” smell, but not always.
- Breathing gas causes the most harm, but ingesting cyanide can be toxic as well.
- Most dangerous in enclosed places where the gas will be trapped.
- Gas evaporates and disperses quickly in open spaces - less harmful outdoors.
- Cyanide gas is less dense than air, so it will rise.
- Exposure may lead to some or all of the following symptoms within minutes:
 - Rapid breathing
 - Restlessness
 - Dizziness
 - Weakness
 - Headache
 - Nausea and vomiting
 - Rapid heart rate
- Exposure to a large amount of cyanide by any route may cause:
 - Convulsions
 - Low blood pressure
 - Slow heart rate
 - Loss of consciousness

Emergency Response in the Community

- Lung injury
- Respiratory failure leading to death
- **If exposed to cyanide:**
- Stay calm. Dial 911 and explain what has happened.
- Get fresh air by leaving the area where the cyanide was released.
- If leaving the area is not an option, stay as low to the ground as possible.
- Remove any clothing that has liquid cyanide on it. Double seal clothing in plastic bags
- Rinse eyes with plain water for 10 to 15 minutes if they are burning or vision is blurred.
- Wash any liquid cyanide from the skin thoroughly with soap and water.
- If cyanide was swallowed, do not induce vomiting or give fluids to drink. Seek medical attention right away.
- Wait for emergency personnel to arrive.

Ricin:

- A poison made from the waste left over from processing castor beans.
- Can be in a powder, mist, or pellet, or can be dissolved in water or weak acid.
- A stable substance, not affected much by extreme heat or cold
- Can be inhaled (mist or powder), ingested in food, or injected
- Injection of a pellet the size of the head of a pin (500 micrograms) is lethal. Much larger amounts would be needed to kill people through inhalation or ingestion.
- Ricin poisoning is not contagious.
- **Signs and symptoms**
- **Inhalation:** Within a few hours symptoms will include:
 - coughing
 - tightness in the chest
 - difficulty breathing
 - nausea
 - aching muscles.
 - Within the next few hours, the body's airways (such as lungs) will become severely inflamed (swollen and hot), excess fluid will build up in the lungs, breathing would become even more difficult, and the skin might turn blue.
- **Ingestion:** Symptoms include
 - internal bleeding leading to vomiting and bloody diarrhea.
 - the liver, spleen, and kidneys stop working, and the person could die.
- **Injection:** Symptoms include
 - muscles and lymph nodes near the injection site will die.
 - the liver, kidneys, and spleen stop working,
 - massive bleeding from the stomach and intestines
 - The person dies from multiple organ failure.
- Death can take place within 36 to 48 hours of exposure. If the person lives longer than 5 days without complications, he or she will probably not die.

Sarin:

- The fastest acting, most volatile man-made chemical warfare nerve agent
- Can easily and quickly evaporate into a vapor and spread into the environment

Emergency Response in the Community

- Exposure may occur through inhalation, skin contact, eye contact, touching or drinking contaminated water, or eating contaminated food.
 - Contaminated clothing can release sarin for about 30 minutes after exposure. Other people can be exposed to sarin if they breathe this sarin gas.
 - Vapor is heavier than air, so it would be more likely to settle in low-lying areas.
 - Because it evaporates quickly, sarin presents an immediate, but short-lived, threat.
 - Exposure will produce the following symptoms within seconds to hours:
 - Runny nose
 - Watery eyes
 - Small, pinpoint pupils
 - Eye pain
 - Blurred vision
 - Drooling and excessive sweating
 - Cough
 - Chest tightness
 - Rapid breathing
 - Diarrhea
 - Increased urination
 - Confusion
 - Drowsiness
 - Weakness
 - Headache
 - Nausea, vomiting, and/or abdominal pain
 - Slow or fast heart rate
 - Low or high blood pressure
 - Exposure to large doses of sarin may cause the following harmful health effects:
 - Loss of consciousness
 - Convulsions
 - Paralysis
 - Respiratory failure possibly leading to death
 - If exposed, rapidly decontaminate and get medical care as quickly as possible
 - Stay calm. Dial 911 and explain what has happened.
 - Leave the area where the sarin was released and get to fresh air
 - Go to the highest ground possible, as sarin is heavier than air
 - Remove any clothing that has liquid sarin on it, double seal the clothing in plastic bags
 - Rinse eyes with plain water for 10 to 15 minutes if they are burning or if vision is blurred
 - Immediately wash liquid sarin from skin with large amounts of soap and water
 - If sarin has been swallowed, do not induce vomiting or give fluids to drink
 - Seek medical attention immediately.
- VX:**
- VX is the most potent, least volatile of all nerve agents. Compared to sarin, VX is much more toxic by entry through the skin and somewhat more toxic if inhaled
 - An odorless, tasteless, oily, amber colored liquid, that evaporates very slowly
 - Exposure can occur through skin contact, eye contact, inhalation, drinking or

Emergency Response in the Community

touching contaminated water, or eating contaminated food.

- Primarily a liquid exposure hazard, but if heated, can become vapor (gas).
- Vapor is heavier than air
- Repeated exposure can have a cumulative effect
- Symptoms appear within seconds after exposure to vapor, within minutes to up to 18 hours after exposure to liquid
- A droplet of liquid VX the size of the head of a pin can be lethal
- Under average weather conditions, VX can last for days on objects that it has come in contact with. Under very cold conditions, VX can last for months.
- Because it evaporates so slowly, VX can be a long-term threat as well as a short-term threat. Surfaces contaminated with VX should therefore be considered a long-term hazard.
- Symptoms may occur with seconds to hours of exposure:
 - Runny nose
 - Watery eyes
 - Small, pinpoint pupils
 - Eye pain
 - Blurred vision
 - Drooling and excessive sweating
 - Cough
 - Chest tightness
 - Rapid breathing
 - Diarrhea
 - Increased urination
 - Confusion
 - Drowsiness
 - Weakness
 - Headache
 - Nausea, vomiting, and/or abdominal pain
 - Slow or fast heart rate
 - Abnormally low or high blood pressure
- Exposure to a large dose of VX by any route may result in these additional health effects:
 - Loss of consciousness
 - Convulsions
 - Paralysis
 - Respiratory failure possibly leading to death

Information About Biological Attack

- Pay close attention to official instructions if you are alerted to potential exposure to biological agents or if an actual attack has caused broad exposure
 - Places to report for triage or treatment and transportation methods and routes may be announced
 - Delivery of medical services may be altered to respond to changing demands.
- If your skin or clothing comes in contact with a visible, potentially infectious substance, remove and bag your clothes and personal items and wash yourself with

Emergency Response in the Community

warm soapy water immediately. Put on clean clothes and seek medical assistance.

Anthrax:

- An acute infectious disease caused by the spore-forming bacterium *Bacillus anthracis*, occurs in hoofed mammals and can also infect humans.
- The serious forms of human anthrax are inhalation, cutaneous, and intestinal
- Symptoms vary depending on how the disease was contracted, but usually occur within 7 days after exposure.
- Initial symptoms of inhalation anthrax infection may resemble a common cold. After several days, symptoms progress to severe breathing problems and shock. Inhalation anthrax is often fatal.
- The intestinal form may follow consumption of contaminated food and is characterized by an acute inflammation of the intestinal tract. Initial signs of nausea, loss of appetite, vomiting, and fever are followed by abdominal pain, vomiting of blood, and severe diarrhea.
- Direct person-to-person spread of anthrax is extremely unlikely, if it occurs at all. Therefore, there is no need to immunize or treat contacts of persons ill with anthrax, such as household contacts, friends, or coworkers, unless they also were also exposed to the same source of infection.
- Early antibiotic treatment of anthrax is essential—delay lessens chances for survival.
- An anthrax vaccine also can prevent infection. Vaccination against anthrax is not recommended for the general public to prevent disease and is not available.

Botulism:

- A muscle-paralyzing bacterial disease (*Clostridium botulinum*)
- Three kinds of botulism:
 - Food borne botulism occurs when a person ingests pre-formed toxin that leads to illness within a few hours to days. Creates a public health emergency because the contaminated food may be available to others.
 - Infant botulism occurs in a small number of susceptible infants who harbor *C. botulinum* in their intestinal tract.
 - Wound botulism occurs when wounds are infected with *C. botulinum* that secretes the toxin.
- With food borne botulism, symptoms begin within 6 hours to 2 weeks (most commonly between 12 and 36 hours) after eating toxin-containing food.
- Symptoms of botulism include
 - double vision
 - blurred vision
 - drooping eyelids
 - slurred speech
 - difficulty swallowing
 - dry mouth
 - muscle weakness that always descends through the body: first shoulders are affected, then upper arms, lower arms, thighs, calves, etc.
 - Paralysis of breathing muscles can cause a person to stop breathing and die, unless assistance with breathing (mechanical ventilation) is provided.

Emergency Response in the Community

- Botulism is not spread from one person to another. Food borne botulism can occur in all age groups.
- CDC maintains a supply of antitoxin against botulism. The antitoxin is effective in reducing the severity of symptoms if administered early in the course of the disease.
- Most patients eventually recover after weeks to months of supportive care.

Plague

- An infectious disease that affects animals and humans, caused by the bacterium *Yersinia pestis*. This bacterium is found in rodents and their fleas and occurs in many areas of the world, including the United States.

- Easily destroyed by sunlight and drying. When released into air, the bacterium will survive for up to one hour, depending on conditions.

- **Pneumonic plague** occurs when *Y. pestis* infects the lungs.

- Can spread from person to person through the air.

- Bacteria can be aerosolized and used in a bioterrorist attack.

- Inhaling *Y. pestis* suspended in respiratory droplets from infected victim

- Usually requires direct and close contact with the victim

- May also occur if a person with bubonic or septicemic plague is untreated and the bacteria spread to the lungs.

- **Bubonic plague** is the most common form of plague.

- Occurs when an infected flea bites a person or when contaminated materials enter through a break in a person's skin.

- Patients develop swollen, tender lymph glands (called buboes), fever, headache, chills, and weakness. Bubonic plague does not spread from person to person.

- **Septicemic plague**

- Occurs when plague bacteria multiply in the blood.

- Can be a complication of pneumonic or bubonic plague or can occur alone

- When it occurs alone, caused the same ways as bubonic plague; however, buboes do not develop.

- Patients have fever, chills, prostration, abdominal pain, shock, and bleeding into skin and other organs.

- Does not spread from person to person.

- **Symptoms and Treatment**

- First signs of illness are fever, headache, weakness, and rapidly developing pneumonia with shortness of breath, chest pain, cough, and sometimes bloody or watery sputum. The pneumonia progresses for 2 to 4 days and may cause respiratory failure and shock. Without early treatment, patients may die.

- **Early treatment of pneumonic plague is essential.**

- To reduce the chance of death, antibiotics must be given within 24 hours of first symptoms.

- Antibiotic treatment for 7 days will protect people who have had direct, close contact with infected patients.

- Wearing a close-fitting surgical mask also protects against infection.

Emergency Response in the Community

- A plague vaccine is not currently available for use in the United States.

Smallpox

- Smallpox is a serious, contagious, and sometimes fatal infectious disease.
- No specific treatment for smallpox disease. The only prevention is vaccination.
- The name *smallpox* is derived from the Latin word for “spotted” and refers to the raised bumps that appear on the face and body of an infected person.
- There are two clinical forms of smallpox.
 - Variola major is the severe and most common form of smallpox, with a more extensive rash and higher fever. Historically, variola major has an overall fatality rate of about 30%; however, flat and hemorrhagic smallpox usually are fatal. There are four types of variola major smallpox:
 - ordinary (most frequent , accounting for 90% or more of cases);
 - modified (mild and occurring in previously vaccinated persons);
 - flat (rare);
 - hemorrhagic (very severe).
 - Variola minor is a less common presentation of smallpox, and a much less severe disease, with death rates historically of 1% or less.
- Except for laboratory stockpiles, the variola virus has been eliminated. However, in the aftermath of the events of September and October, 2001, there is heightened concern that the variola virus might be used as an agent of bioterrorism.
- Generally, direct and fairly prolonged face-to-face contact is required to spread smallpox from one person to another.
- Smallpox also can be spread through direct contact with infected bodily fluids or contaminated objects such as bedding or clothing.
- Rarely, smallpox has been spread by virus carried in the air in enclosed settings such as buildings, buses, and trains.
- Humans are the only natural hosts of variola. Smallpox is not known to be transmitted by insects or animals.
- A person with smallpox is sometimes contagious with onset of fever (prodrome phase), but the person becomes most contagious with the onset of rash. At this stage the infected person is usually very sick and not able to move around in the community.
- The infected person is contagious until the last smallpox scab falls off.

Tularemia

- Tularemia is an infectious disease caused by a hardy bacterium, *Francisella tularensis*, found in animals (especially rodents, rabbits, and hares).
- People can get tularemia many different ways, such as through the bite of an infected insect or other arthropod (usually a tick or deerfly), handling infected animal carcasses, eating or drinking contaminated food or water, or breathing in *F. tularensis*.
- Symptoms of tularemia could include:
 - sudden fever
 - chills
 - headaches

Emergency Response in the Community

- muscle aches
- joint pain
- dry cough
- progressive weakness
- pneumonia.
 - chest pain
 - bloody spit
 - trouble breathing or can sometimes stop breathing.
- Other symptoms of tularemia depend on how a person was exposed to the tularemia bacteria.
 - ulcers on the skin or mouth
 - swollen and painful lymph glands
 - swollen and painful eyes
 - sore throat.
- Symptoms usually appear 3 to 5 days after exposure to the bacteria, but can take as long as 14 days.
- Tularemia is not known to be spread from person to person, so people who have tularemia do not need to be isolated.
- People exposed to *F. tularensis* should be treated as soon as possible.
- The disease can be fatal if it is not treated with the appropriate antibiotics.
- A vaccine for tularemia is not currently available in the United States.

Viral Hemorrhagic Fevers (Ebola hemorrhagic fever or Ebola HF)

- Ebola HF is a severe, often-fatal disease in humans and nonhuman primates (monkeys, gorillas, and chimpanzees) that has appeared sporadically 1976.
- Disease is caused by infection with Ebola virus, one of two members of a family of RNA viruses called the Filoviridae.
- Four subtypes of Ebola virus, three of which have caused disease in humans:
 - Ebola-Zaire
 - Ebola-Sudan
 - Ebola-Ivory Coast
 - Ebola-Reston has caused disease in primates, but not in humans
- The exact origin, locations, and natural habitat of Ebola virus remain unknown.
- Researchers believe that the virus is zoonotic (animal-borne) , normally maintained in an animal host that is native to the African continent.

- A similar host is probably associated with Ebola-Reston, which was isolated from infected cynomolgous monkeys that were imported to the United States and Italy from the Philippines.
- Not known to be native to other continents, such as North America.
- Infections with Ebola virus are acute. There is no carrier state.
- Researchers hypothesize that a patient may be infected through contact with an infected animal.
- After the first case patient in an outbreak setting is infected, the virus can be transmitted in several ways.
 - Direct contact with the blood and/or secretions of an infected person. The virus is often spread through families and friends because they come in

Emergency Response in the Community

close contact with such secretions when caring for infected persons.

- Contact with objects, such as contaminated needles
- The incubation period for Ebola HF ranges from 2 to 21 days.
- The onset of illness is abrupt and is characterized by
 - fever
 - headache
 - joint and muscle aches
 - sore throat
 - weakness, followed by diarrhea, vomiting, and stomach pain.
 - rash, red eyes, hiccups, internal and external bleeding may be seen
- Researchers do not understand why some people are able to recover from Ebola HF and others are not. Patients who die usually have not developed a significant immune response to the virus at the time of death.
- There is no standard treatment for Ebola HF. Patients receive supportive therapy.
 - balancing the patient's fluids and electrolytes
 - maintaining oxygen status and blood pressure
 - treating them for any complicating infections.

Information About Nuclear Attack

- Learn the warning signals and all sources of warning used in your community. Make sure you know what the signals are, what they mean, how they will be used, and what you should do if you hear them.
- Assemble and maintain a disaster supply kit with food, water, medications, fuel and personal items adequate for up to 2 weeks—the more the better.
- Find out what public buildings in your community may have been designated as fallout shelters. It may have been years ago, but start there, and learn which buildings are still in use and could be designated as shelters again
 - Call your local emergency management office.
 - Look for yellow and black fallout shelter signs on public buildings.
 - Make your own list of potential shelters near your home, workplace, or school
 - Give family members clear information about actions to take in case of attack.
 - Talk to apartment or office building management about the safest place in the building for shelter and provisions for occupants until it is safe to go out.
- Learn about community evacuation plans, routes, relocation sites, notification and transportation options.
- If you live in an apartment building or high-rise, talk to the manager about the safest place in the building for sheltering, and about providing for building occupants until it is safe to go out.

Responding to Nuclear Attack

- If you hear an attack warning:
 - Do not look at the flash or fireball - it can blind you.
 - Take cover as quickly as you can, below ground if possible, and stay there unless instructed to do otherwise
 - If you are caught outside, take cover behind anything that might offer protection. Lie flat on the ground and cover your head.
 - Protect yourself from radioactive fallout. Take shelter even if you are many

Emergency Response in the Community

miles from the center of the explosion.

- Listen to radio broadcasts for official information and follow instructions.

Recovery from Nuclear or Radiological Attack

- Do not leave shelter until officials say it is safe. Follow instructions when leaving.
- Make every effort to maintain sanitary conditions in shelter space
- Use water and food sparingly
- Cooperate with shelter officials and others in the shelter. Living with many people in confined space can be difficult and unpleasant. Look for ways to maintain a positive attitude, morale, and interpersonal relations with others.
- When returning to your residence, check for any sign of collapse, damage, or structural weakness.
- Immediately clean up spilled medicines, flammable liquids, and other potentially hazardous materials.
- Wait for utility companies to restore water, electricity, gas and sewage service. Turn utilities on only and use them only after you have confirmed that water, electrical, gas, and sewage service lines are intact.
- Stay away from areas marked "radiation hazard" or "HAZMAT."
